Abstract

Funded since 2001 by National Science Foundation, an innovative open courseware (http://nm.mathforcollege.com) has been developed for a comprehensive undergraduate course in Numerical Methods. The open courseware resources enhance instructor preparation and development as well as the student educational experience by facilitating a hybrid educational approach to the teaching of Numerical Methods, a pivotal STEM course, via customized textbooks, adapted course websites, social networking, digital audiovisual lectures, concept tests, self-assessment of the level of learning via online multiple-choice question tests and algorithm-based unlimited attempt quizzes, worksheets in a computational system of choice, and real-life applications based on the choice of one’s STEM major. The resources have been implemented successfully at the University of South Florida, Arizona State University, Old Dominion University, Milwaukee School of Engineering, and Mississippi Valley State University. With philosophies of open dissemination and pedagogical neutrality, more than 30 institutions and thousands of individual users have adopted the resources in an \textit{a la carte} fashion. In this paper, we discuss the history, philosophy, development, refinement, assessment process, and future of the open courseware. The summarized assessment results include those of comparing several instructional modalities, measuring student learning, effect of collecting homework for a grade, using online quizzes as a substitute for grading homework, interpreting summative ratings of the courseware, student satisfaction, and Google Analytics.

History

In 1990, the first author of this paper thought of developing MS-DOS based simulations and textbook chapters for a course in Numerical Methods. He would use QuickBasic \citep{1} to develop the simulations and WordPerfect \citep{2} to write the textbook. He would distribute these by US mail to various Numerical Methods instructors via 1.44MB floppy disks. This idea was pitched in 1990 in a proposal to the newly established NSF Instrumentation and Laboratory Improvement (ILI) program \citep{3}. The proposal received good reviews and was not funded, primarily because the emphasis of the ILI program then was on hardware-oriented laboratory improvement. A resubmission of the revised proposal in 1991 was not funded either.

Shelving the idea for 9 years, in 2000, the first author along with the eighth author (a fellow mechanical engineering professor with a background in finite element methods and statistical analysis) applied again to get the proposal funded. This time we applied to the Course, Curriculum and Innovation (CCLI) program of NSF, a program that had unfolded from the ILI program in 1999. The CCLI program “gave increased priority to testing the
effectiveness of materials and practices in terms of gains in student learning” [4]. By Year 2000, much had also changed in the computational world – internet was being embraced as a medium to provide information, computational packages such as Mathcad [5] were being used in engineering curriculums, Microsoft Office [6] had made keen advances in word processing and presentation software, and the Acrobat Reader [7] made reading documents accessible free-of-charge on multiple platforms. All these advances were incorporated in the revised proposal. Again, the proposal was rejected but mainly for the lack of an assessment expert from the education field.

In April 2001, MIT announced [8] its open courseware initiative [9] where they would publish online course materials such as course syllabus, lecture notes, digital audiovisual lectures, assignments and examinations. In 2002, they published their first set of 50 courses. More than 2,000 courses have since been published. Combined with the acceptance of such ideas of open courseware and teaming with the sixth author from the College of Education at USF, a revised proposal to the NSF CCLI program was finally funded in 2001 [10]. Since then we received two expansion CCLI grants [11,12] and one more CCLI prototype grant [13] for the development, assessment, refinement and revision of the comprehensive open courseware for Numerical Methods. We call these resources: Holistic Numerical Methods (HNM).

Development

The topics (Figure 1) covered in the developed Numerical Methods open courseware [14] include

1. Introduction to Scientific Computing,
2. Differentiation,
3. Nonlinear Equations,
4. Simultaneous Linear Equations,
5. Interpolation,
6. Regression,
7. Integration,
8. Ordinary Differential Equations,
9. Partial Differential Equations,
10. Optimization, and

Figure 1: Home page of the numerical methods open courseware.
The open courseware available at http://nm.mathforcollege.com consists of resources that are available in multiple-context and modes of access. The context items include

1. primers for pre-requisite knowledge,
2. textbook chapters,
3. digital audiovisual lectures,
4. presentations,
5. worksheets,
6. real-life applications, and
7. multiple-choice quizzes.

1. Primers for Pre-requisite Knowledge: The pre-requisite courses to a typical Numerical Methods course include the Calculus series, Ordinary Differential Equations and Programming. To make it simpler and specific for students to review the pre-requisite information, short primers have been developed for topics such as quadratic equations, Taylor series, differential calculus, integral calculus, and ordinary differential equations. These include multiple-choice tests and related audiovisual lectures.

2. Textbook Chapters: Dividing each of the 11 topics into subtopics for modular purposes, a textbook chapter has been written for each subtopic. Because of the modular nature of the HNM resources, using self-publishing[15] and semi-automated compilation programs, we have developed customized textbooks for various programs. This has reduced the weight and cost of the textbook.

3. Digital Audiovisual Lectures: More than 300 modular digital audiovisual lectures [16, 17] (Figure 2) that span a comprehensive course in Numerical Methods have been uploaded to YouTube [18]. These audiovisual lectures work seamlessly with mobile devices such as smartphones, notebooks and tablets.

4. Presentations: PowerPoint presentations have been developed for all topics. The examples in the presentations are based on one’s major of choice so that instructors and students can quickly relate to the topic at hand.

5. Worksheets: The worksheets illustrating various numerical methods are developed in four popular computational systems – Mathcad [5], Mathematica [19], Maple [20], and MATLAB [21]. These are not simulations as we wanted to recreate handwritten solutions of numerical methods examples. But why develop the worksheets in four separate systems?

- First, for continuity, cost, and pedagogy, a college may select and employ only one of these packages across their curriculum.
- Second, there is no additional cost involved if a university already has a site license to just one of the four computational systems.
- Third, given a choice, students are typically reluctant to learn a second computational system if they already know one.
- Fourth, those motivated can use an alternate computational system to gain greater proficiency in it.

6. Real-Life Applications: Typically, when a Numerical Methods course is taught,
instructors either focus on the methods while paying little attention to showing their applications in the STEM majors, or put most of the emphasis on solving STEM problems via computational systems while spending little time on the algorithms of numerical methods. The open courseware allows users to do both by choosing specific real-life examples to illustrate numerical methods applications and procedures from each of the engineering disciplines (other STEM disciplines choose General Engineering applications). For example, at USF, throughout the Numerical Methods course, we interweave a single problem of shrink-fitting procedure of a bascule bridge (Figure 3) [22].

Figure 3. Real-life application of a trunnion being shrink-fitted into a hub to form the fulcrum assembly of a bascule bridge.

The real-life examples from different engineering majors also provide the critical cross-disciplinary opportunity for students and instructors to see how others use numerical methods.

7. Multiple-Choice Quizzes: Each sub-topic is followed by a 6-question multiple-choice quiz (Figure 4). The quizzes mostly follow the first four levels of Bloom’s taxonomy [23]. The quizzes are automatically graded, and the feedback is instant. A student can take the quiz multiple times, but the questions stay the same. We are currently looking at replacing some of the questions in each quiz with algorithmic solutions which will allow random values of input variables.

The access modes include resources in original software format, Acrobat reader, etc. For example, a multiple-choice quiz resource is available in four formats - MS Word, Acrobat PDF, HTML and Flash [24]. Such access modes are essential in reaching a broad audience who has different levels of access to the internet and software, and to encourage re-use and re-distribution as per a Creative Commons License [25].

Implementation

The HNM resources have been adapted and implemented successfully at the University of South Florida, Old Dominion University, Arizona State University, the Milwaukee School of Engineering, and Mississippi Valley State University. With philosophies of open dissemination and pedagogical neutrality, an additional 30 institutions and thousands of individual users have adopted the HNM resources in an a la carte fashion. Implementation has been done not only in STEM Numerical Methods courses, but also in other courses such as Finite Element Methods, Political Science, Linear
Algebra, Psychometric Studies, and Mathematics for Economics and Business.

Assessment

The current project courseware and assessment of its impact was evaluated via a variety of satisfaction assessment and examination instruments, and transparent analytics tools. Only a brief summary of the important results is provided here as detailed data and statistical interpretation are provided elsewhere in Refs. [26-32].

1. Quantitative Assessment Based on Bloom’s Taxonomy: All students were given a multiple-choice final examination. The examination questions were not exactly the same at all four institutions because the syllabus and approach in the course differed at each institution. However, more than 50% of the questions were common on these examinations and covered both the lower-three and higher-three levels as outlined by Bloom and colleagues in their classic taxonomy in the cognitive domain [23].

Statistical procedures to measure changes in instructional effectiveness from semester to semester were computed. A two-tailed t-test comparing the final examination grade of students between the two treatments of before and after implementation of the HNM resources are given in Table 1.

2. Concept Test: A concept test was used as an assessment tool to measure student learning and its improvement during the course. The concept test comprised of 16-multiple-choice questions (two from each of the eight topics covered at USF) and was given in the beginning and end of the class for three semesters at USF.

The basis of the distractors in the multiple-choice test was classroom questioning, homework assignments, and tests. This “informal approach” is the reason why we call our test a “concept test” and not a “concept inventory”. Nonetheless, the concept test also does not fall in the category of a “diagnostic test” either. Our focus was in finding how well the students understand the fundamental background concepts of numerical methods, and how much they gained in the understanding of these concepts by the end of the semester.

Table 1. Comparison of final examination results (maximum final exam score is 100) before formal implementation and after full implementation (N=number of students taking the final examination, μ=average final examination score, σ=standard deviation of final examination score).

<table>
<thead>
<tr>
<th>University</th>
<th>Semester before formal implementation</th>
<th>Semester after full implementation</th>
<th>Statistically Significant Improvement</th>
</tr>
</thead>
<tbody>
<tr>
<td>USF</td>
<td>N=41, μ=56.4, σ=13.4</td>
<td>N=62, μ=69.0, σ=12.0</td>
<td>Yes (t(101)=4.97, p&lt;0.01)</td>
</tr>
<tr>
<td>ODU(^a)</td>
<td>N=51, μ=61.9, σ=8.9</td>
<td>N=58, μ=70.0, σ=9.3</td>
<td>Yes (t(107)=1.98, p&lt;0.01)</td>
</tr>
<tr>
<td>ASU(^b)</td>
<td>N=71, μ=70.6, σ=12.0</td>
<td></td>
<td>N/A</td>
</tr>
<tr>
<td>MVSU</td>
<td>N=3, μ=30.0, σ=16.6</td>
<td>N=5, μ=43.6, σ=16.9</td>
<td>Yes (by observation; small sample size)</td>
</tr>
</tbody>
</table>

\(^a\) Because of the philosophy of open dissemination, students had informal access to most of the HNM resources in Fall 2008 (baseline semester) at ODU before formal implementation; the post-formal implementation results are for Fall 2011.

\(^b\) ASU already was using the textbook resources before becoming a grant partner and hence we do not have pre-implementation results. However, ASU uses almost (88% of the questions are identical) the same examination as USF, and their average and standard deviation results are comparable to that of USF.
### Table 2. Student performance in pre- and post-concept test over three semesters at USF.

<table>
<thead>
<tr>
<th>Semester</th>
<th>Average Number of Correct Answers in Pre-test (mean/st.dev.)</th>
<th>Average Number of Correct Answers in Post-test (mean/st.dev.)</th>
<th>Hake’s Gain Index</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spring 2008</td>

<td>11.0/2.7</td>
<td>0.36</td>
</tr>
<tr>
<td>Spring 2009</td>
<td>8.3/3.5</td>
<td>11.6/3.9</td>
<td>0.43</td>
</tr>
<tr>
<td>Spring 2010</td>
<td>9.2/2.6</td>
<td>12.0/2.2</td>
<td>0.41</td>
</tr>
</tbody>
</table>

The improvement in students’ performance between the pre-test and the post-test is summarized in Table 2. A paired t-test with p<0.001 indicated significant difference between the mean number of correct answers in the pre- and post-concept tests.

A method to quantify student learning is to calculate the Hake’s gain index [33], which is defined as follows

\[
g = \frac{\mu_{post} - \mu_{pre}}{100 - \mu_{pre}}
\]

Where

\[
\mu_{pre} = \text{mean percentage score of the pre-test},
\]
\[
\mu_{post} = \text{mean percentage score of the post-test}.
\]

The Hake’s gain index in Equation (1) ranges from 0 to 1, where 0 is a measure of no gain and 1 is a measure of maximum possible gain. The Hake’s gain index for the three semesters was 0.36, 0.42, and 0.41, respectively, indicating increased student learning of the basic concepts.

The analysis discussed in detail in Ref [32] showed that certain subgroups’ performance in the pre- and post-concepts test is significantly better than others. For example, students with prerequisite GPA≥3.0 perform better than those with prerequisite GPA<3.0, and non-adult students perform better than adult students do. The latter may be attributed to adult students having a larger time gap between taking the Numerical Methods course and its pre-requisites.

3. Digital Audiovisual Content Assessment: To assess the effectiveness of lecture videos, a pilot study [29] was conducted at USF for a single instructional unit (Nonlinear Equations) over separate administrations (2002-06) to study four instructional delivery modalities:

- **Modality a**: Traditional lecture (traditional face-to-face mode without benefit of web-based materials)
- **Modality b**: Web-enhanced lecture (face-to-face mode with active learning via multiple-choice questions and small calculation questions, and benefit of supplementary web-based content)
- **Modality c**: Web-based self-study (learning only via primary content available on the web)
- **Modality d**: Combined web-based self-study and classroom discussion (learning via primary content available on the web outside the classroom, and followed by Q&A classroom discussion)

Videotaped topics were made available as part of the web-based content for Modalities c and d. To compare the delivery modalities, student achievement on a multiple-choice examination (part of the final examination) and a student satisfaction survey were used. We found that the use of web-based modules provides students with greater satisfaction and an enhanced likelihood to succeed in the course. Students in the Modality b cohort tended to have more favorable survey ratings as compared to the other three groups of students (Table 3) and students in the Modality b and Modality d cohorts performed consistently better on achievement measures (Table 4).

Most respondents considered use of a distance learning modality as positive, tending to cite availability of a variety of resources and flexibility as strengths of the web-based materials. Complete statistical analysis details and qualitative data of this assessment are available in Ref. [29].

4. Summative Course Rating: Students assessed the HNM resources using a summative rating [26] based on five critical factors – a) content, b) learning, c) delivery support, d) usability, and e) technology. For each factor, questions asked are based on technology standards and are rated on a 0-4 (Absent to Excellent) Likert scale. Average reported ratings over several semesters at USF, ASU and MSOE are given in Table 5.

Table 5. Summative open courseware rating (0-absent to 4-excellent)

</tbody>
</table>

In response to qualitative questions, students liked the videos, simple “no frills” navigation, the multiple-choice tests, and access to additional examples from other engineering majors. Complete statistical analysis details and qualitative data of this assessment are available in Ref. [26].

5. External Evaluators: The online-developed modules were evaluated by four independent Numerical Methods instructors (Table 6). These instructors each teach a course in Numerical Methods in their respective institutions, and their years of teaching experience range from 3 to 35 years (average=19 years). They teach courses to a variety of engineering majors and use different computational software systems. The feedback received from these evaluators was incorporated in the HNM resources.
In answers to qualitative questions, the reviewers found the HNM resources to be effective without being overwhelming. The level of presentation and choice of real-world problems were found to be very appropriate. The holistic approach was highly appreciated, as was the flexibility to choose among the sub-modules. Complete statistical analysis details and qualitative data are available in Ref. [26].

6. Analytics: Google analytics [34] were used to analyze the visits to the open courseware by the general user. “Google Analytics shows you how people found your site, how they explored it, and how you can enhance their visitor experience” – Google Analytics. The site has been tracked since April 2008, and it has played a key role in modifying and improving the access to the users worldwide. The following items provided by Google Analytics (Figure 5) were used in the process.

a) Top content topics: This gives the web links that are most popular with the users. The top content showed that web pages that collated all the resources for a particular numerical method on a single page were the most popular. Using this analytic result, we developed individual web pages for all the numerical methods and linked them from the home page of the open courseware.

b) Referring sites: This information allows finding the sites that refer to the open courseware. So far, other than search engines and direct hits, Wikipedia is the largest referring site. But what is most important is to be able to readily find institutional (.edu) sites and educational blogs that refer to the open courseware. This gives a fair idea of how and which universities are using the HNM resources, and helps us target the commercial dissemination of textbooks for self-sustaining the project.

c) Traffic Sources: The traffic sources are tracked by three categories – search engines, referring sites and direct traffic. Table 7 shows these categories by numbers for 2009 and 2011.

Table 6. External evaluation average rating (1-truly inadequate to 7-truly outstanding) results of HNM resources.

<table>
<thead>
<tr>
<th>The HNM resources were helpful</th>
<th>5.7</th>
</tr>
</thead>
<tbody>
<tr>
<td>as a supplement</td>
<td>5.7</td>
</tr>
<tr>
<td>for class presentations</td>
<td>5.7</td>
</tr>
<tr>
<td>for problem assignments</td>
<td>5.3</td>
</tr>
<tr>
<td>in developing higher order thinking and problem solving skills</td>
<td>4.7</td>
</tr>
<tr>
<td>for relevance to engineering major</td>
<td>5.7</td>
</tr>
</tbody>
</table>

Figure 5. Google analytics report on site visitors in 2011.
Table 7 Visits by traffic sources.

<table>
<thead>
<tr>
<th>Traffic Source</th>
<th>2009</th>
<th>2011</th>
<th>Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search Engines</td>
<td>124,585 (55%)</td>
<td>170,946 (50%)</td>
<td>37%</td>
</tr>
<tr>
<td>Referring Sites</td>
<td>60,255 (26%)</td>
<td>82,734 (24%)</td>
<td>37%</td>
</tr>
<tr>
<td>Direct Traffic</td>
<td>43,918 (19%)</td>
<td>91,440 (26%)</td>
<td>108%</td>
</tr>
</tbody>
</table>

The visits from each of the traffic sources are increasing. The direct traffic has increased by 108%, a testimony that the open courseware is being recognized as a definite source for numerical methods. In fact, for the search phrase of “numerical methods” the open courseware is ranked #2 on all major search engines - Google™, Yahoo™, and Bing™ (after Wikipedia).

d) Search words: This is a set of popular search words used that send users to the open courseware. Again, these search words have been used to develop an alphabetically ordered keyword web page. This directs the users quickly to the relevant information.

e) Site Usage: Five parameters are tracked in this category and are shown in Table 8 for 2009 and 2011.

Table 8 Change in yearly site usage.

<table>
<thead>
<tr>
<th>Factor</th>
<th>2009</th>
<th>2011</th>
<th>Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visits</td>
<td>228,758</td>
<td>345,121</td>
<td>51%</td>
</tr>
<tr>
<td>Page Views</td>
<td>679,262</td>
<td>1,077,702</td>
<td>58%</td>
</tr>
<tr>
<td>Pages/Visit</td>
<td>2.97</td>
<td>3.12</td>
<td>5%</td>
</tr>
<tr>
<td>Bounce Rate</td>
<td>58%</td>
<td>54%</td>
<td>-7%</td>
</tr>
<tr>
<td>Average Time</td>
<td>00:04:09</td>
<td>00:04:28</td>
<td>8%</td>
</tr>
</tbody>
</table>

From 2009 to 2011, the visits to the open courseware and page views have increased by more than 50%. The bounce rate, a measure of percentage of users leaving the open courseware for another rather than going to other pages of the open courseware, has also decreased by 7%. Users are spending 8% more time on the open courseware, although a long time is not necessarily better for a reference site.

Future of the Open Courseware

The authors are currently seeking support to adapt, implement and assess the open courseware in nine other universities, and conduct national workshops to train faculty in the use and improving of awareness of the open courseware.

The overarching question we want to answer is: “To what extent would the expansion of open courseware to the diverse institutions enhance student learning (cognitive and affective), ownership of learning, and ability to demonstrate greater competence in Numerical Methods-type courses that are critical to successful completion of STEM programs?” We also plan to create several new instructional materials to improve student learning and develop assessment tools to measure these learning gains as follows:

1. Concept Inventory: Ever since the Force Concept Inventory [35] explored the student’s understanding of a first course in College Physics, concept inventories [36-38] have become a favored assessment tool in identifying students’ conceptual misunderstandings and inadequacies, and in measuring student-learning gains. We are planning to develop a Concept Inventory for the course using a rigorous and well-established methodology based on Delphi methodology[39].

2. Simulations: The worksheets written in the four computational systems for the open courseware are not written to develop simulations of various numerical methods but to emulate the step-by-step procedure of the numerical methods. To develop simulations in a stable and professional environment, we have developed prototype Wolfram demonstrations [40] to simulate graphically (Figure 6) various numerical methods, and related concepts of convergence and pitfalls. These demonstrations are used in class to illustrate the workings of a numerical method and students are encouraged to use them at home while reviewing the course material. The ultimate goal of these simulations is to embed them into ebooks along with digital audiovisual lectures and

---

c The searches were conducted on December 30, 2011.
interactive quizzes to develop the next generation of ebooks that are free.

![Wolfram Demonstrations Project](image)

**Figure 6.** An example of a Wolfram demo illustrating the approximation of the first derivative of a function.

3. Unlimited Attempts Self-Assessment Quizzes (UASQs): Self-assessment with unlimited attempts to solve problems allows students to become actively engaged with the information and their learning [41]. As a prototype, we implemented in the course-management system of Blackboard [42], three “unlimited-attempts self-assessment quizzes” (UASQ) for the topic of Simultaneous Linear Equations (SLE). Each of the 3 quizzes (Figure 7) had 6-7 questions that were of algorithmic form, which allowed the instructor to choose some or all input variables to take values within a pre-determined range, and develop a formula for the correct answer.

When a student took the quiz, the system randomly chose the values of the selected variables, and answered the question by filling in the answer field. The student’s answer was checked against the correct value. Feedback, including the answer and its correctness, was provided immediately.

A limited amount of time (10 days from the start of the first sub-topic), but unlimited attempts to complete all three quizzes, was given. The number of attempts, the time taken, and the score for each attempt were recorded automatically by Blackboard [42].

To measure the effectiveness of the UASQs, the following treatments were used. For the topic of Simultaneous Linear Equations (SLE), in 2009, homework problems were assigned from the book but not collected for a grade, while in 2010, we assigned and graded (3% of overall grade) the UASQs. Under the two treatments, the scores of the SLE questions on the final examination were compiled and the results are shown in Table 9.

While the first row in Table 9 shows a notable improvement in the performance of all students in the SLE questions, we were prescriptively curious if this improvement is more pronounced for particular subgroups based on pre-requisite GPA.

![Algorithmic Quizzes](image)

**Figure 7.** Unlimited self-assessment algorithmic quizzes.
Table 9. SLE final examination score (maximum score is 4) before and after implementation of UASQs (N=number of students taking the exam, \( \mu = \) average score, \( \sigma^2 \) = variance in exam scores, \( p = p \)-value).

<table>
<thead>
<tr>
<th>Pre-requisite GPA</th>
<th>UASQs</th>
<th>SLE Final Examination Scores</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Before</td>
<td>N=110, ( \mu=2.7, \sigma^2=0.9 )</td>
</tr>
<tr>
<td></td>
<td>After</td>
<td>N=134, ( \mu=2.9, \sigma^2=0.9 )</td>
</tr>
<tr>
<td>0.00-2.49</td>
<td>Before</td>
<td>N=16, ( \mu=2.7, \sigma^2=0.7 )</td>
</tr>
<tr>
<td></td>
<td>After</td>
<td>N=22, ( \mu=2.6, \sigma^2=0.7 )</td>
</tr>
<tr>
<td>2.50-3.50</td>
<td>Before</td>
<td>N=79, ( \mu=2.6, \sigma^2=1.0 )</td>
</tr>
<tr>
<td></td>
<td>After</td>
<td>N=83, ( \mu=2.9, \sigma^2=1.0 )</td>
</tr>
<tr>
<td>3.51-4.00</td>
<td>Before</td>
<td>N=15, ( \mu=3.2, \sigma^2=0.5 )</td>
</tr>
<tr>
<td></td>
<td>After</td>
<td>N=29, ( \mu=3.0, \sigma^2=0.7 )</td>
</tr>
</tbody>
</table>

The high \( p \)-values indicate that the observed differences are very likely attributable to chance for the subgroup of students with pre-requisite GPA between 0.00-2.50 and 3.50-4.00. However, for the subgroup of students with pre-requisite GPA between 2.50 and 3.50 (corresponding to 62% of the entire sample), UASQs had a significant positive impact in student learning of the material related to SLEs.

The statistical results of the UASQ prototype study also revealed that overall students’ learning styles, self-efficacy, pre-requisite grades, number of attempts, and time duration with UASQs did not have a significant relationship to the students’ UASQ scores. This is possibly a positive outcome of the UASQ environment because regardless of the students pre-course disposition, they can be successful with demonstrating knowledge of SLE if they have unlimited access and time with UASQs.

Focus groups and surveys exploring the experience with the UASQs also were conducted. Overall, the students indicated that they really enjoyed working with UASQs for several reasons:

- UASQs were helpful in preparing the students for their exams, and the structure directed their study. They felt that they studied more than they would have without UASQs, and they enjoyed getting the immediate feedback to help with “the little things”.
- UASQs helped them identify immediately what they did and did not know. This was considered important to them because when they did the UASQs they knew right away what they got right and wrong. In the traditional homework assignments, “you don't really know what you've gotten right or wrong until much later.”

Based on the above observations, we are planning to develop and assess the effectiveness of these unlimited assessment quizzes for all topics of a typical course in Numerical Methods.

Biographical Information

Autar Kaw is a Professor of Mechanical Engineering and Jerome Krivanek Distinguished Teacher at the University of South Florida, USA. He holds a Ph.D. (1987) in engineering mechanics from Clemson University. His main scholarly interests are in engineering education research methods, open courseware development, bascule bridge design, body armor, and micromechanics of composite materials. With major funding from the NSF, he is the lead developer of award-winning online resources for an undergraduate course in numerical methods (http://nm.mathforcollege.com). He is the recipient of the 2011 ASEE Outstanding Teaching Award and the 2004 U.S. Florida Professor of the Year Award from the Council for Advancement and Support of Education (CASE) and the Carnegie Foundation for the Advancement of Teaching (CFAT).

Ali Yalcin is an Associate Professor of Industrial and Management Systems Engineering at the University of South Florida. His research interests include systems modeling, analysis and control, production planning and control, industrial information systems, data analysis and decision support in healthcare, and engineering education research. He teaches courses in the areas of systems modeling and performance analysis, information systems design, production planning, facilities design, and systems simulation. He is also the co-author of the Design of Industrial Information Systems textbook which received the 2007 IIE/Joint Publishers Book-of-the-Year Award.

James Eison is a Professor of Higher Education at the University of South Florida. He received his Ph.D. (1979) in Psychology from the University of Tennessee, Knoxville. He has written over 40 articles and has co-authored two texts – Making Sense of College Grades (Jossey-Bass, 1986) and Active Learning: Creating Excitement in the Classroom (ASHE-ERIC, 1991). His scholarly interests in higher education span a wide range of topic areas focusing largely around teaching, learning, assessment, and faculty development. His work has been funded by National Science Foundation.

Corina Owens, Ph.D., is a quantitative methodologist for the Battelle Memorial Institute. Her areas of expertise include multilevel modeling, meta-analysis and single-case research. She earned her B.A. degree in interdisciplinary Social Sciences (2002), an M.A.T. degree in Social Science Education (2006), and a Ph.D. in Measurement and Evaluation from the University of South Florida (2011). She has served as a lead evaluator on grants funded by the U.S. Department of Education and the National Science Foundation.
Glen Besterfield is a faculty member of the Department of Mechanical Engineering at University of South Florida. He received his B.S. degree from the Missouri University of Science and Technology, M.S. degree from Purdue University, and his Ph.D. from Northwestern University, all in mechanical engineering. His research interests include computational mechanics, numerical methods, bascule bridges, rehabilitation engineering, and engineering education, all of which were funded via National Science Foundation, Air Force Office of Scientific Research, and the Florida Department of Transportation. Furthermore, he has also co-written a book entitled *Total Quality Management* (Prentice-Hall) which is in its third edition.

Gwen Lee-Thomas, Ph.D., is the CEO of Quality Measures, LLC. She has been an external consultant for more than 13 years, serving businesses as well as two- and four-year private and public colleges and universities in several states, on strategies in diversity, STEM education, organizational culture, and leadership. She has conducted more than 30 workshops and presentations on cultural, racial, and generational diversity; assessment, evaluation, and accreditation; teaching and learning; and leadership. She taught organization administration, culture, and the project management capstone course as an Adjunct at Old Dominion University in the graduate program of the Darden College of Education. Prior to Old Dominion University where she recently served as the Assistant to the President and Provost for Special Projects, she was the Director of Assessment from 1998 through 2004 at Rose-Hulman Institute of Technology.

Duc Nguyen is a Professor of Civil Engineering at Old Dominion University since 1985. His teaching activities, 4 published textbooks, research works with over 150 publications in refereed journals, conference proceedings, and technical reports, and funded projects of more than $3.5 million in Large-Scale Parallel Computational Mechanics and Equation Solvers have led to several awards at all levels. His research and educational accomplishments have been included in the ISIHighlyCited.com list of most highly cited engineers/researchers in the world.

Melinda R. Hess, Ph.D., is the CEO of REALL, Inc, a company that conducts research, evaluation, and assessment of living and learning. She is the past Director of the Center for Research, Evaluation, Assessment, and Measurement (CREAM) at the University of South Florida. She has written and presented over 30 papers at technology and education research conferences, and has co-authored two chapters in educational methods books. She is the Editor of the Florida Journal of Educational Research.

Ram Pendyala is a Professor in the School of Sustainable Engineering and the Built Environment at Arizona State University. He specializes in transportation systems engineering and has published extensively on topics related to the planning, operation, and design of various modes of transportation. His professional activities include service on several journal editorial boards, leadership of committees for the Transportation Research Board and the American Society of Civil Engineers, and organization of international conferences related to sustainable transport development. He is also involved in the implementation of new pedagogical techniques and web-based resources for instruction in courses on numerical methods for engineers. He received his Ph.D. in Civil Engineering from the University of California, Davis.
