

## **Exploring Engineering Identity in a Common Introduction to Engineering Course to Improve Retention**

### **Dr. Michele Yatchmeneff, University of Alaska Anchorage**

Michele Yatchmeneff is Unangax (Aleut) who grew up living a traditional subsistence lifestyle in rural villages along Alaska's Aleutian chain. She earned a BS in Civil Engineering in 2005 and an MS in Engineering Management in 2009 at University of Alaska Anchorage. After earning her BS she began working in Alaska's construction and engineering industry, specializing in water and sewer projects in remote villages across the state. She also worked as the Deputy Director of the Alaska Native Science & Engineering Program (ANSEP). Professor Yatchmeneff earned her PhD in Engineering Education from Purdue University in 2015. She is currently an Assistant Professor of Civil Engineering at the University of Alaska Anchorage. Her research focuses on motivation and success for Alaska Native pre-college students.

### **Dr. Matthew Calhoun, University of Alaska Anchorage**

Dr. Matthew Calhoun is a civil engineering assistant professor at the University of Alaska Anchorage. Prior to his tenure-track position, he worked as a project engineer in the Alaskan construction industry followed by managing the pre-college component of the Alaska Native Science & Engineering Program (ANSEP). He has earned a PhD in civil engineering from the University of Alaska Fairbanks, a MS in civil engineering from the University of Colorado at Boulder, and a BS in civil engineering from the University of Alaska Anchorage.

# Exploring Engineering Identity in a Common Introduction to Engineering Course to Improve Retention

## Abstract

This complete research paper describes the efficacy of first-year retention interventions focused on engineering identity that were developed for a common Introduction to Engineering course. This research aims to improve retention rates where presently about half of the engineering undergraduate students exit or drop out<sup>1</sup>. The American Society of Engineering Education (ASEE) has indicated that engineering universities should develop retention programs to reduce these numbers<sup>1-3</sup>. One of the main recommendations is to develop first-year retention programs<sup>1-3</sup>. At one university, two engineering professors developed first-year retention interventions into the common Introduction to Engineering course they teach. The main interventions employed included refocusing the course on engineering identity. To measure if these interventions were effective, an engineering identity pre and post survey was given to four common Introduction to Engineering courses, which comprised of 169 high school and undergraduate students who completed the courses taught in 2016.

The survey instrument used in this study was largely adopted from Prybutok, Patrick, Borrego, Seepersad, and Kiristis<sup>4</sup> who completed a similar study. This paper discusses the quantitative results from these engineering identity pre and post surveys. Engineering factors that significantly improved from the pre to the post surveys included: performance/competence, design efficacy, recognition by others, and recognition by self. The other engineering factors measured that were found to not have significantly improved included: interest, creativity, caring, and major selection. These interventions improved the students' engineering identities. Future work should include conducting a paired survey where the participants' pre and post survey results are connected. Future work should also include analyzing the qualitative data provided in these surveys.

## Introduction

Engineering identity is one avenue that engineering educators can use to help improve retention<sup>4,5</sup>. Engineering identity is described as “the process of identifying with engineering, developing an engineer identity, and becoming an engineer”<sup>6</sup> (pp. 1-2). Engineering identity is identified as an important concept to consider in order to retain females and minority students or those who are underrepresented in engineering<sup>4-7</sup>. The goal for incorporating engineering identity in the common Introduction to Engineering course was to help improve retention and persistence of students by having them identify themselves early as engineers.

The survey instrument used in this study was largely adopted from Prybutok, Patrick, Borrego, Seepersad, and Kiristis<sup>4</sup> who completed a similar study. Prybutok, Patrick, Borrego, Seepersad, and Kiristis<sup>4</sup> developed their engineering identity survey based on a physics identity model<sup>8,9</sup>. This physics model used four factors: performance, competence, interest, and recognition<sup>4,8,9</sup>. Performance is where a student believes in their ability to perform tasks specific to engineering<sup>4</sup>. Competence is when a student believes in their ability to be success in engineering<sup>4</sup>. Prybutok, Patrick, Borrego, Seepersad, and Kiristis<sup>4</sup> described interest as “how motivated a student is in the

content and career they are pursuing, often encompassing the motives a student has for pursuing engineering” (p. 2). Lastly, recognition is when a student is seen by others as an engineer and then if they themselves recognize themselves as an engineer<sup>4</sup>. Prybutok, Patrick, Borrego, Seepersad, and Kiristis<sup>4</sup>, using the physics model<sup>8,9</sup>, developed their own survey that included engineering factors: performance/competence, interest, creativity, design efficacy, recognition by others, recognition by self, and caring.

The professors used several tactics to incorporate engineering identity in the common Introduction to Engineering course. First, the professors incorporated more information about each of the four engineering disciplines that are offered at the university to help them improve their engineering interest. Second, students were required to complete daily team activities that helped them explore a topic within each of the engineering disciplines. For example, following a discussion on mechanical engineering, students were asked to design a wheelchair that could operate in both sand and snow. Students would work in teams to come up with a design, how the chair would be powered, and how much the chair would cost. These activities were designed to help improve their engineering performance/competence, interest, creativity, and design efficacy. Third, to help students improve their communication skills, students were also required to present their results from these team activities in front of the class. It is possible that explaining engineering topics in front of the class helps others and themselves seeing themselves as engineers. Fourth, students were also required to develop one-minute engineering identity presentations as their final individual project. Students were asked to explain what kind of engineers they wanted to become (civil, mechanical, etc.), their definition of engineering, why they cared about becoming an engineer, and where they saw themselves in 5 or 10 years. These presentations were designed to help students to start visualizing themselves as engineers or improve their engineering recognition and caring. Fifth, the students were also asked to develop cardboard chairs for their final team project. Students work together in teams to develop the chairs and then present their chair to the class. This project was designed to help students improve their engineering performance/competence, interest, creativity, and design efficacy. Lastly, students were required to complete weekly homework assignments where they personally reflect on topics such as their engineering interests, study plan, and any barriers they can foresee that might prevent them from becoming an engineer. These were designed to improve their engineering performance/competence, interest, and caring.

## **Methods**

### *Study Participants*

Participants in the study were high school or undergraduate engineering students. High school students voluntarily participated in the common Introduction to Engineering course so they could receive college credits while they were still in high school. Undergraduate students at this university are typically directly admitted into their specific engineering majors because there are no first-year engineering programs. The common Introduction to Engineering course is a first-year engineering course that is required for all the undergraduate engineering students to complete.

There were 169 students who participated in the pre survey. Of these 169 students, 47 (27.8%) were female. When the post surveys were given, there were students who missed class or withdrawn from the course. Therefore, only 132 students completed the post survey. Of these 132 students, 37 (28.0%) were female. It is also possible that a couple of those that took the post survey were not present for the pre survey. Refer to Table 1 which shows the number and percent of gender and ethnicity of the students that participated in this study.

**Table 1.** Number and Percent of Gender and Ethnicity of Study Participants

|                               | Pre        |             | Post       |             |
|-------------------------------|------------|-------------|------------|-------------|
|                               | Number     | Percent (%) | Number     | Percent (%) |

|                               | <b>169</b> | <b>100</b>  | <b>132</b> | <b>100</b>  |

### *Survey and Data Collection*

The survey instrument used in this study was largely adopted from Prybutok, Patrick, Borrego, Seepersad, and Kiristis<sup>4</sup> who completed a similar study. The engineering factors and questions used from the survey Prybutok, Patrick, Borrego, Seepersad, and Kiristis<sup>4</sup> developed, included: performance/competence, interest, creativity, design efficacy, recognition by others, recognition by self, and caring<sup>4</sup>. The only questions not used from the survey Prybutok, Patrick, Borrego, Seepersad, and Kiristis<sup>4</sup> developed, included the physics and math identity questions.

An additional survey section was developed for this study which included having students indicate their selected engineering major. The survey used in this study had a total of 29 engineering identity questions, of which 27 were Likert scale questions, one was a combination of both Likert scale and open-ended question, and one was an open-ended question. Refer to Table. 2 for a list of the engineering factors, 28 Likert survey items, and response scales used. The open-ended question asked the students: “Can you describe why you *care* about becoming an engineer?”. The survey also asked for students to indicate their gender and ethnicity. This survey was given to the students on the first day of class to collect their pre responses and then

on the last day of class to collect their post responses. This survey required 10 minutes of class time for the students to complete it.

**Table 2.** Engineering Factor Survey Items and Likert Response Scales

| <b>Engineering Factor</b>  | <b>Survey Item</b>                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>Likert Response Scale</b>                                                                                                  |

|                 |                                                                                                                                                                                                                                                               |                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| Caring          | In your opinion, to what extent are the following associated with the field of engineering?<br><ul style="list-style-type: none"> <li>• Saving lives</li> <li>• Caring for communities</li> <li>• Protecting the environment</li> </ul>                       | 1 for Not at All<br>2 for A little bit<br>3 for Somewhat<br>4 for Quite a bit<br>5 for Very Much So |
| Major Selection | What kind of engineer do you want to be?<br><ul style="list-style-type: none"> <li>• Civil Engineer</li> <li>• Computer Systems Engineer</li> <li>• Electrical Engineer</li> <li>• Mechanical Engineer</li> <li>• Other/Undecided (please specify)</li> </ul> | 1 for Not at All<br>2 for A little bit<br>3 for Somewhat<br>4 for Quite a bit<br>5 for Very Much So |

These engineering factors, survey questions, and Likert response scales, except for “Major Selection” were adopted from Prybutok, Patrick, Borrego, Seepersad, and Kiristis<sup>4</sup>.

### *Analysis Procedures*

The data was manually compiled and coded from the surveys collected. Questions where students did not respond were cleaned from the data. Refer to Table 3 for the engineering factors and the corresponding percent response rates. The engineering major selection questions had the lowest response rates. It appeared this is because students only answered the question for the engineering major(s) they selected but left the other questions blank. The recognition by self response rates were also a bit lower than the other questions. This was because students sometimes left the question for “do engineering instructor(s) see you as an engineer?” blank. It is suspected that this question was left blank because the common Introduction to Engineering course was most likely the first course where the students interacted with an engineering instructor, therefore they did not know how to answer that question during their pre survey.

**Table 3.** Engineering Factors and Corresponding Percent Response Rate

| Engineering Factor      | Percent Response Rate (%) |      |
|-------------------------|---------------------------|------|
|                         | Pre                       | Post |
| Performance/ Competence | 97.8                      | 99.7 |
| Interest                | 98.1                      | 99.5 |
| Creativity              | 97.8                      | 99.7 |
| Design Efficacy         | 97.6                      | 98.1 |
| Recognition by Others   | 97.6                      | 97.5 |
| Recognition by Self     | 91.7                      | 95.8 |
| Caring                  | 97.8                      | 97.7 |
| Major Selection         | 55.0                      | 60.3 |

### **Results**

Refer to Table 4 for the engineering factors their corresponding mean responses found from the pre and post surveys, the difference between the pre and post surveys, and corresponding p-values from the t-tests conducted. The engineering factors that improved significantly from the

pre to the post surveys included: performance/competence, design efficacy, recognition by others, and recognition by self. The engineering factors that did not significantly increase from the pre to post surveys included: interest, creativity, caring, and major selection.

**Table 4.** Engineering Factors Pre and Post Survey Means and Difference Between Pre and Post Means

| Engineering Factor     | Mean |      |            | P-Value |
|------------------------|------|------|------------|---------|
|                        | Pre  | Post | Difference |         |
| Performance/Competence | 4.06 | 4.21 | 0.151      | 0.0000* |
| Interest               | 4.38 | 4.42 | 0.039      | 0.2961  |
| Creativity             | 4.16 | 4.23 | 0.073      | 0.1813  |

| Major Selection        | 3.13 | 3.24 | 0.116      | 0.1858  |

\* p-value < 0.05

## Discussion

In conclusion, the engineering factors of performance/competence, design efficacy, recognition by others, and recognition by self, all significantly improved from the pre to post surveys indicating an improvement in students' engineering identity. The pre and post survey mean for performance/competence increased by staying in the Likert scale range of 4 corresponding to a response of "Agree". However, the pre and post means for engineering factors of design efficacy, recognition by others, and recognition by self all increased from being in the range of 3 to being in the range of 4 on the Likert scale. For the engineering factor of design efficacy, this shift in mean refers to responses moving from "Somewhat Confident" to "Agree". For these shifts in means for engineering factors of recognition by others and recognition by self refers to responses moving from "Sometimes" to "Often". Further research could find which specific engineering identity intervention activities were helpful in improving these engineering identity factors.

It is unclear why the engineering factors of interest, creativity, caring, and major selection did not significantly increase. The professors should develop more engineering identity interventions that are specifically directed at the engineering factors that did not significantly improve. For example, conducting a lecture specifically on engineering caring and having students work in teams on a related activity. Connecting the participants pre and post surveys, or doing a paired study, would have shown which students increased their engineering identity and in which factors.

The professors should also continue to improve the common Introduction to Engineering course and evaluate if these engineering identity interventions are effective. It is possible that these engineering identity interventions could be included in other common engineering courses to

help improve retention and persistence of engineering students. Future research should also look into other areas to improve such as mentoring and tutoring<sup>2,3</sup>.
